SDN Project Report

Flow Rule Timeout Manager

Project #22

Student	Vinay
Controller	Ryu (OpenFlow 1.3)
Emulator	Mininet on Ubuntu 22.04 (VMware)
IDLE_TIMEOUT	10 seconds
HARD_TIMEOUT	30 seconds
Blocked Host	10.0.0.4
Date	April 17, 2026

1. Introduction

Software Defined Networking (SDN) separates the control plane from the data plane, allowing centralized management of network flow rules through a programmable controller. This project implements a Flow Rule Timeout Manager using the Ryu SDN controller and Mininet network emulator. The objective is to demonstrate how OpenFlow flow rules can be automatically removed after idle or hard timeout periods, analyze the lifecycle of flow rules, enforce blocked host policies, and regression-test consistent timeout behavior.

1.1 Objectives

- Configure idle and hard timeouts on OpenFlow 1.3 flow rules
- Automatically remove expired rules via the switch (OFPFlowRemoved event)
- Demonstrate the complete flow rule lifecycle: install → active → expire
- Enforce DROP rules for blocked hosts (10.0.0.4)
- Regression test: verify timeout behavior remains consistent across runs

2. Network Topology

The topology consists of one Open vSwitch (OVS) connected to four hosts managed by a remote Ryu controller running on localhost port 6633. All links operate at 10 Mbps. Host h4 (10.0.0.4) is designated as a blocked host — any packet from it triggers installation of a DROP flow rule at priority 10.

Host	IP Address	MAC Address	Status
h1	10.0.0.1/24	00:00:00:00:00:01	Allowed
h2	10.0.0.2/24	00:00:00:00:00:02	Allowed
h3	10.0.0.3/24	00:00:00:00:00:03	Allowed
h4	**10.0.0.4/24**	**00:00:00:00:00:04**	**BLOCKED (DROP)**

3. Implementation

3.1 Flow Rule Timeout Configuration

Each flow rule is installed using the OFPFlowMod message with both idle_timeout and hard_timeout parameters. The key code snippet:

```
mod = parser.OFPFlowMod(
    datapath=datapath,
    priority=priority,
    match=match,
    instructions=inst,
    idle_timeout=10,   # Remove if no traffic for 10s
    hard_timeout=30    # Always remove after 30s
)
```

3.2 Flow Removed Event Handler

The controller listens for OFPFlowRemoved events from the switch. When a rule expires due to IDLE_TIMEOUT or HARD_TIMEOUT, the event is logged with timestamp, reason, duration, and packet/byte counts. The reason codes are: OFPRR_IDLE_TIMEOUT, OFPRR_HARD_TIMEOUT, and OFPRR_DELETE.

3.3 Blocked Host Enforcement

When a packet from blocked host 10.0.0.4 is detected via PacketIn, a DROP rule is installed at priority=10 with an empty actions list. This causes the switch to silently drop all subsequent packets from that host until the rule expires after idle_timeout (10 seconds).

4. Results & Screenshots

Figure 1: Screenshot 1 — Controller Started (Terminal 1)

```
(venv) vinay@vinay-VMware-Virtual-Platform:~/ryu$ cd ~/ryu && source venv/bin/activate
ryu-manager ~/ryu/project/timeout_manager.py --observe-links
1 RLock(s) were not greened, to fix this error make sure you run eventlet.monkey_patch() before importing any other modules.
loading app /home/vinay/ryu/project/timeout_manager.py
loading app ryu.controller.ofp_handler
instantiating app /home/vinay/ryu/project/timeout_manager.py of FlowTimeoutManager
============================================================
  Flow Rule Timeout Manager Started
  IDLE_TIMEOUT  = 10s
  HARD_TIMEOUT  = 30s
  BLOCKED_HOSTS = ['10.0.0.4']
============================================================
instantiating app ryu.controller.ofp_handler of OFPHandler
```

Ryu controller starts showing IDLE_TIMEOUT=10s, HARD_TIMEOUT=30s, and BLOCKED_HOSTS=['10.0.0.4']. OFPHandler initialized and ready.

Figure 2: Screenshot 2 — Blocked Host + Flow Installation (Terminal 1)

```
[SWITCH] Disconnected: dpid=None

  priority=1 idle=10s hard=30s duration=3s packets=2
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=4
[BLOCKED] Packet from 10.0.0.4 to 10.0.0.1 — DROP rule installed.
[FLOW INSTALLED] dpid=1 priority=10 idle=10s hard=30s total=5

[FLOW TABLE] Switch dpid=1 - 5 active flow(s):
  priority=10 idle=10s hard=30s duration=4s packets=3
  priority=1 idle=10s hard=30s duration=8s packets=5
  priority=1 idle=10s hard=30s duration=8s packets=4
  priority=1 idle=10s hard=30s duration=4s packets=0
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=6
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=7
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=8
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=9
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=10
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=11
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=12
```

[SWITCH] Connected: dpid=1. [BLOCKED] Packet from 10.0.0.4 — DROP rule installed at priority=10. Normal forwarding rules at priority=1

Figure 3: Screenshot 3 — Flow Expiry / Timeout (Terminal 1)

```
[FLOW TABLE] Switch dpid=1 - 7 active flow(s):
  priority=10 idle=10s hard=30s duration=9s packets=3
  priority=1 idle=10s hard=30s duration=13s packets=5
  priority=1 idle=10s hard=30s duration=13s packets=4
  priority=1 idle=10s hard=30s duration=9s packets=0
  priority=1 idle=10s hard=30s duration=4s packets=446
  priority=1 idle=10s hard=30s duration=4s packets=444

[FLOW TABLE] Switch dpid=1 - 3 active flow(s):
  priority=1 idle=10s hard=30s duration=9s packets=553
  priority=1 idle=10s hard=30s duration=9s packets=551

[FLOW TABLE] Switch dpid=1 - 3 active flow(s):
  priority=1 idle=10s hard=30s duration=14s packets=553
  priority=1 idle=10s hard=30s duration=14s packets=551

[FLOW TABLE] Switch dpid=1 - 1 active flow(s):
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=13
[FLOW INSTALLED] dpid=1 priority=1 idle=10s hard=30s total=14

[FLOW TABLE] Switch dpid=1 - 3 active flow(s):
  priority=1 idle=10s hard=30s duration=4s packets=3
  priority=1 idle=10s hard=30s duration=4s packets=3

[FLOW TABLE] Switch dpid=1 - 3 active flow(s):
  priority=1 idle=10s hard=30s duration=9s packets=3
  priority=1 idle=10s hard=30s duration=9s packets=3

[FLOW TABLE] Switch dpid=1 - 1 active flow(s):
```

Flow table reduces: 7 active flows → 3 → 1 (only table-miss remains). Demonstrates IDLE_TIMEOUT working — rules expire after 10s of no traffic.

Figure 4: Screenshot 4 — Scenario 1 & 2 (Terminal 2)

============================================================
  FLOW RULE TIMEOUT MANAGER - TEST TOPOLOGY
============================================================
  h1=10.0.0.1(allowed) h2=10.0.0.2(allowed)
  h3=10.0.0.3(allowed) h4=10.0.0.4(BLOCKED)
============================================================
*** Waiting for controller...

--- SCENARIO 1: Normal Forwarding (h1 -> h2) ---
PING 10.0.0.2 (10.0.0.2) 56(84) bytes of data.
64 bytes from 10.0.0.2: icmp_seq=1 ttl=64 time=4.14 ms
64 bytes from 10.0.0.2: icmp_seq=2 ttl=64 time=0.526 ms
64 bytes from 10.0.0.2: icmp_seq=3 ttl=64 time=0.075 ms
64 bytes from 10.0.0.2: icmp_seq=4 ttl=64 time=0.096 ms

--- 10.0.0.2 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3078ms
rtt min/avg/max/mdev = 0.075/1.209/4.140/1.701 ms

--- SCENARIO 2: Blocked Host (h4 -> h1) ---
PING 10.0.0.1 (10.0.0.1) 56(84) bytes of data.

--- 10.0.0.1 ping statistics ---
4 packets transmitted, 0 received, 100% packet loss, time 3062ms
```

After 15s wait (flows expired), h1→h2 ping again = 0% packet loss. Flows re-installed (total=13,14). Consistent behavior confirmed.

5. Test Scenarios & Results

#	Scenario	Command	Expected	Result
1	Normal Forwarding h1 → h2	h1 ping -c 4 10.0.0.2	0% packet loss	✓ PASS
2	Blocked Host h4 → h1	h4 ping -c 4 -W 1 10.0.0.1	100% packet loss	✓ PASS
3	Throughput Test h1 → h3	h1 iperf -c 10.0.0.3 -t 5	~9–10 Mbits/sec	✓ PASS
4	IDLE_TIMEOUT Wait 15 seconds	time.sleep(15)	Flow table: 7→1	✓ PASS
5	Regression Test h1 → h2 again	h1 ping -c 4 10.0.0.2	0% packet loss	✓ PASS

6. Flow Rule Lifecycle Analysis

The following table summarizes the observed flow rule lifecycle during the experiment:

Event	Log Message	Time
Switch connects	[SWITCH] Connected: dpid=1	t=0s
Table-miss installed	[FLOW INSTALLED] priority=0 idle=0s hard=0s total=1	t=0s
Normal flow installed	[FLOW INSTALLED] priority=1 idle=10s hard=30s total=2	t=5s
Blocked host detected	[BLOCKED] Packet from 10.0.0.4 — DROP rule installed	t=15s
DROP rule installed	[FLOW INSTALLED] priority=10 idle=10s hard=30s total=5	t=15s
Iperf flows installed	[FLOW INSTALLED] priority=1 idle=10s hard=30s total=12	t=20s
IDLE_TIMEOUT fires	Flow table: 7 → 3 → 1 active flow(s)	t=35s
Regression flows	[FLOW INSTALLED] priority=1 idle=10s hard=30s total=14	t=50s

7. Conclusion

This project successfully implemented and demonstrated a Flow Rule Timeout Manager in an SDN environment using Ryu controller and Mininet. Key achievements:

- Flow rules were installed with idle_timeout=10s and hard_timeout=30s via OFPFlowMod.

- The OFPFlowRemoved event was correctly handled to log rule expiry with reason, duration, and statistics.
- The flow table was observed reducing from 7 active flows to 1 (table-miss only) after timeout.
- Blocked host 10.0.0.4 was successfully isolated using a priority=10 DROP rule.
- Regression testing confirmed consistent timeout behavior — flows re-installed after expiry, maintaining 0% packet loss.

The project demonstrates a practical application of OpenFlow timeout mechanisms for dynamic network policy enforcement — fundamental to real-world SDN deployments such as security enforcement, QoS management, and network resource optimization.
